Sore and cracked nipples can be a real problem for breast-feeding mothers. This issue is one of the most common reasons moms stop breast-feeding early in their experience. As much as 96% of breast-feeding moms report at least some nipple discomfort during the first 6 weeks after the birth of a baby. There are many possible contributors to the development of sore and cracked nipples during breast-feeding, so you should always speak to your physician, nurse and/or lactation consultant about your experiences and ask them for help and guidance in how you might decrease your discomfort.

Nipple injuries can really interfere with your breast-feeding experience. The best treatment for nipple injuries is prevention! However, when they do occur, MediHoney® Wound and Burn Dressing may be used to help provide protection to the area, decrease chafing and help the injury to close.

MediHoney Paste (100% Active *Leptospermum* Honey) is the most appropriate of the MediHoney products for this use. When using MediHoney, we recommend the following:

- After nursing, gently cleanse the nipple area with a warm washcloth to remove any of the baby’s saliva.
- Extrude a small amount of MediHoney from the tube and gently apply to the nipple and the areola (the colored area around the nipple)
- Apply a nursing pad over the nipple area and wear a bra to help secure the pad
- Just prior to nursing your baby, use a warm wet washcloth to clean off any MediHoney prior to allowing the baby to latch.

MediHoney Paste is 100% honey and contains no additives and is filtered and sterilized to remove any bacteria or spores.
